LOW COST OPERATIONAL AMPLIFIER

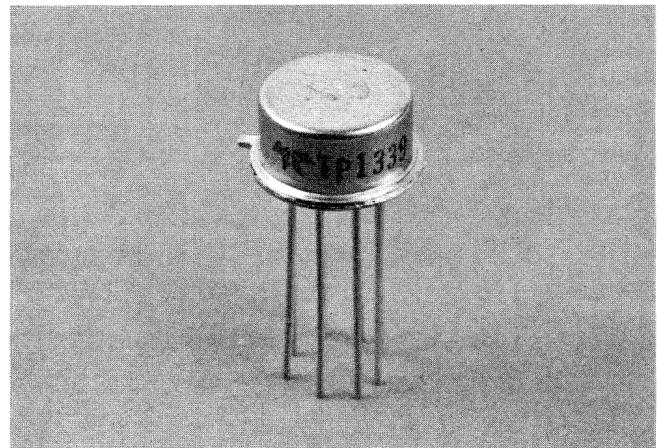

Teledyne Philbrick Models 1339, 1339-01, 1339-02 operational amplifiers are designed to be superior to, and directly interchangeable with the popular 1439 types. Key parameters such as output current, open loop gain, input offset voltage, offset current, slew rate, CMRR, and thermal stability have been optimized for high performance.

Model 1339-01 has tighter specifications for output current, open loop gain, thermal stability, bias current and offset current. Model 1339-02 is the highest performance version with an extended temperature range of -55 to $+125^{\circ}\text{C}$. Included in the 1339-02 specifications is a low initial offset voltage that eliminates the need for offset trimming in many dc applications.

All versions are "latch-up" proof with high slew rate for reliable operation in applications such as comparators. The amplifier's design incorporates input and output protection for added reliability.

For maximum versatility in applications, the 1339 series uses optional three component frequency compensation for "tailoring" optimum stability and slew rate.

For reliable operation, the use of highly stable power supplies is always recommended. Teledyne Philbrick manufactures a comprehensive line of power supplies designed for microcircuit operation. Models 2210 or 2403 are recommended.

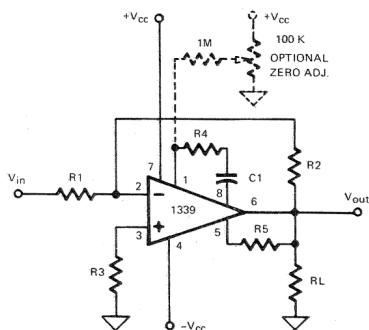

FEATURES

- Latch-up Proof
- High Slew Rate – $34 \text{ V}/\mu\text{sec}$
- Input/Output Protection
- Premium Versions Available

APPLICATIONS

- Adder/Subtractor
- Voltage Follower
- Comparator
- Sample-and-Hold
